

One of these things is just like the other

The Highlander Script can be written a number of different ways depending on selection ordering and assumption, which can yield varied results. When running four variations of the script, we can see below that for each of the four countries the distribution of sites that fall into the different "buckets" (fine complete, coarse complete, etc.) looks almost identical from one variation to the next. This result implies that we can be confident that minor tweaks in the algorithm, will still give us the same results.
